

# Subflow Health Overview

Subflow Health is a healthcare technology company focused on helping organizations deliver evidence-based care beyond the traditional visit. At its core, Subflow Health is a care orchestration, automation, and patient engagement platform built to extend care outside the walls of the clinic, improve adherence, reduce manual administrative burden, and give care teams better visibility into what is happening between encounters.

Subflow is not just a texting tool, and it is not an EHR. It is the layer that sits around and between healthcare workflows to help care teams design, automate, deliver, and measure care programs over time. The platform is designed for longitudinal care, meaning it supports the entire journey of care before, during, after, and between visits rather than focusing only on isolated point-in-time interactions.

The company's broader vision is to become the infrastructure that helps healthcare organizations orchestrate care programs across patients, care teams, providers, payers, and partners. The goal is to make it easier for healthcare organizations to deliver timely guidance, automate repetitive tasks, improve patient follow-through, and collect actionable data that helps drive better decisions and outcomes.

A core part of Subflow Health's identity is that it enables frictionless patient access. The company strongly believes that many patient engagement tools fail because they depend too heavily on patient portals, apps, passwords, and logins. Subflow is built around the idea that care should meet patients where they already are, especially through channels like text messaging, email, and simple web experiences that reduce friction and increase participation.

## What Subflow Health Is

Subflow Health is best understood as a care orchestration and engagement platform for healthcare.

It helps healthcare organizations:

- automate workflows tied to patient care
- deliver education, reminders, surveys, and follow-up content
- monitor patient engagement and adherence
- guide patients to next steps in their care journey
- reduce manual staff workload
- create structured digital care programs
- capture data throughout the patient journey
- surface insights that help teams intervene earlier

The platform supports both operational efficiency and clinical engagement. That means it is useful both for reducing staff burden and for improving patient participation in care plans, recovery plans, chronic condition programs, referrals, and other longitudinal workflows.

Subflow can support a wide range of workflows, including onboarding, intake, pre-op preparation, post-op recovery, referral coordination, ongoing chronic care management, preventive care outreach, surveys, education delivery, and care navigation.

## What Subflow Health Is Not

It is important for a support team to understand what Subflow is not, because that shapes both customer expectations and product messaging.

Subflow is not:

- an EHR or EMR
- a system of record for full clinical documentation
- a basic bulk SMS marketing platform
- a patient portal that depends on app downloads and complex logins
- a replacement for all clinical systems
- just a survey tool or just a content library

Instead, it complements the systems providers already use. It acts as a workflow and engagement layer that can integrate with core systems and make care delivery outside of visits more scalable and measurable.

## The Core Problem Subflow Solves

Healthcare organizations often deliver care well during a visit, but struggle to manage what happens before the visit, after the visit, or between visits. A large amount of important care depends on patient follow-through outside of the clinic:

- reading education materials
- preparing correctly for procedures
- completing rehab exercises
- reporting symptoms
- filling out forms
- responding to reminders
- attending referrals
- showing up to appointments
- understanding next steps
- adhering to care plans over time

These activities are often managed manually by staff through phone calls, paper handouts, portal messages, spreadsheets, or fragmented systems. This creates several common problems:

- staff spend too much time on repetitive manual tasks
- patients forget or ignore instructions
- engagement rates are inconsistent
- organizations cannot easily measure what patients actually did

- care teams lack visibility into risk and drop-off points
- patients fall through the cracks between visits
- follow-up workflows are hard to scale

Subflow solves this by helping organizations create automated, trackable, patient-friendly workflows that drive action and make follow-through easier.

## Core Positioning and Value Proposition

Subflow Health is often described as enabling evidence-based care beyond the visit.

That means the platform helps organizations take real care pathways, education protocols, operational follow-up steps, and patient communication strategies and turn them into structured digital programs that can be delivered consistently and measured over time.

The value proposition typically includes:

- improve adherence
- reduce manual burden on staff
- increase operational efficiency
- support better outcomes
- create more consistent care delivery
- increase patient satisfaction
- identify risk earlier
- support revenue-generating and outcome-based programs
- provide analytics on what is actually happening between visits

For some customers, the biggest value is operational efficiency. For others, it is patient engagement. For others, it is data, automation, and a better way to run care programs at scale. In many cases, it is a combination of all three.

## How the Platform Thinks About Care Delivery

Subflow is built around the idea that care can be designed, automated, delivered, monitored, and improved in a structured way.

A helpful internal model is that Subflow supports five major layers:

### 1. Design Layer

This is how care is structured.

Organizations can define digital care programs, often referred to as care plans or flows, made up of phases, steps, and tasks. These can represent real patient journeys such as:

- new patient onboarding
- pre-op preparation
- post-op recovery

- pulmonary rehab
- chronic care follow-up
- referral coordination
- educational pathways
- population health check-ins

The design layer gives teams a way to organize what should happen and when it should happen.

## **2. Execution Layer**

This is how care is automated and delivered.

Using automation logic, Subflow can trigger steps based on events such as:

- patient creation
- a scheduled date
- a surgery date
- form submission
- a missed task
- a discharge event
- referral creation
- survey response
- external system updates

The system then takes action such as:

- sending a text or email
- assigning a task
- progressing a patient to the next step
- notifying staff
- delivering education
- sending a survey
- triggering another automation

## **3. Engagement Layer**

This is how patients and care teams participate.

Subflow helps organizations engage patients through low-friction communication methods like:

- SMS/text
- email
- secure web-based experiences
- chat
- digital forms
- educational content
- live or scheduled interactions, depending on customer implementation

The goal is to reduce barriers so patients actually participate.

## **4. Intelligence Layer**

This is how activity becomes insight.

Subflow captures engagement and workflow data across the patient journey. That can include:

- messages sent
- messages received
- link clicks
- content views
- form completions
- survey responses
- task completions
- drop-off points
- adherence indicators
- patient-reported outcomes

This can be used to identify who is engaging, who is not, where people are falling behind, and what signals suggest a need for intervention.

## **5. Action Layer**

This is how insight turns into action.

When the platform detects an issue or reaches a rule threshold, it can help organizations respond by:

- alerting a care team member
- assigning a follow-up task
- escalating a patient workflow
- triggering the next message or resource
- surfacing a patient as higher risk
- guiding the patient toward the next appropriate step of care

# **Key Platform Features**

Below is a more detailed breakdown of important features and functional areas in Subflow.

## **Patient Communication**

Subflow supports patient communication across multiple channels, with SMS as a major strength because of its high open rates and low friction. This enables care teams to send:

- reminders
- educational messages

- updates
- follow-up prompts
- surveys
- resource links
- calls to action

Communication can be one-way or two-way depending on the workflow and implementation. The emphasis is on making communication timely, relevant, and simple for the patient to engage with.

## **Automation Workflows**

Automation is one of the most important parts of Subflow.

Customers can build workflows that trigger actions based on specific dates, events, or patient behavior. This allows organizations to reduce manual coordination and create more reliable follow-up.

Examples of automation actions include:

- sending pre-op instructions seven days before surgery
- reminding a patient to complete intake forms
- following up after discharge
- checking whether a patient completed a survey
- escalating non-response to staff
- assigning an internal task after a patient reports a concerning symptom
- moving a patient to the next care phase based on completion of a milestone

This is critical for scale because it allows a smaller team to manage a much larger patient population with more consistency.

## **Care Plans / Structured Programs**

Subflow supports structured care journeys. These are often built as phases or step-based programs that reflect how care should happen over time.

A care plan may include:

- educational milestones
- tasks for the patient
- tasks for staff
- forms and surveys
- automated messages
- timelines tied to clinical events
- conditional branching based on patient responses

This allows care delivery to become more standardized, while still supporting personalization.

## Forms

Forms are used to collect information from patients or other users. These can support:

- onboarding
- intake
- contact information collection
- consent workflows
- symptom collection
- surveys
- screening questions
- updates to patient records

Forms are important because they give customers a flexible way to gather needed information and trigger automations based on responses.

## Surveys and Patient-Reported Outcomes

Subflow can be used to collect patient feedback and outcomes data.

This includes:

- NPS surveys
- satisfaction surveys
- symptom check-ins
- patient-reported outcome measures
- adherence check-ins
- recovery progress surveys

This is valuable both for direct care and for measuring program effectiveness.

## Contact and Patient Record Management

Subflow includes a patient/contact layer that stores core information used to power communications and workflows. Depending on implementation, this may include:

- name
- phone number
- email
- date-based milestones
- procedure details
- care plan enrollment
- tags or segmentation data
- form and survey history
- engagement history

The platform is not intended to replace the EHR as the legal system of record, but it does maintain enough structured patient data to support workflows and engagement.

## **Segmentation**

Customers can create segments or groups based on attributes or behavior.

This can help support:

- outreach to certain patient populations
- filtering by diagnosis or procedure type
- identifying non-responders
- targeting education to the right groups
- tracking populations with shared program criteria

Segmentation improves relevance and allows more tailored engagement.

## **Content Delivery**

Content is a major part of Subflow's value.

Organizations can host and deliver content such as:

- educational articles
- post-op instructions
- exercise plans
- wellness resources
- clinical guidance
- videos
- course-like experiences
- links to external resources

This content can be embedded into workflows and sent at the right time in the patient journey. A big part of Subflow's approach is helping organizations deliver the right content at the right moment rather than dumping everything into a portal and expecting patients to go find it.

## **Messaging and Conversations**

Subflow supports direct communication workflows and can enable staff-to-patient engagement in a more centralized and trackable way than personal texting or disconnected systems.

This can help organizations:

- maintain brand consistency
- protect privacy
- reduce dependence on personal cell phones
- centralize communication history
- make outreach more measurable

## **Tasks and Internal Follow-Up**

Subflow can create and manage tasks tied to workflows. These tasks may be for internal staff or related to patient progress.

Examples:

- follow up with a patient who has not completed a form
- review a survey response
- call a patient flagged as at-risk
- confirm referral completion
- assign next-step outreach to a coordinator

This helps bridge automation and human intervention.

## **Analytics and Reporting**

Subflow captures engagement and workflow data that can be used to report on operational and clinical program performance.

Metrics may include:

- message delivery and response rates
- survey completion
- content engagement
- workflow completion
- adherence by program
- task completion
- patient participation
- NPS and satisfaction
- risk flags
- referral completion
- engagement over time

This reporting helps customers understand what is working, where friction exists, and how their programs are performing.

## **AI and Insights**

Subflow has a growing emphasis on intelligence and AI-driven insights.

The broader vision is to use workflow activity, engagement patterns, and patient responses to help organizations:

- identify risk earlier
- spot drop-off trends
- understand who needs intervention
- automate next-best actions
- improve program effectiveness over time

This may include AI-assisted segmentation, insight generation, or workflow intelligence depending on the product maturity and implementation context.

## **Integration Support**

Subflow is designed to work alongside external systems.

Common integration goals include:

- creating patient records from an EHR
- syncing surgery dates or appointment dates
- triggering pre-op and post-op workflows
- receiving discharge events
- pushing outcomes or engagement data back into another system
- receiving referral-related data
- syncing updates when dates or statuses change

The platform is API-first and built to support integration patterns rather than operate in a silo.

## **Who Subflow Health Serves**

Subflow serves healthcare organizations that need a better way to automate and manage care outside traditional encounters.

The target customer types can include:

### **Community Health Centers**

CHCs often deal with high patient needs, limited staffing, and large manual follow-up workloads. Subflow can help extend care outside the clinic, improve communication, support education and navigation, and reduce staff burden for underserved populations.

### **Multi-Site Provider Groups and MSOs**

Larger provider organizations need consistency across locations and workflows. Subflow can help standardize communication, automate common programs, and create repeatable patient journeys across multiple sites.

### **Specialty Clinics**

Specialty clinics often have important pre-visit, post-visit, or between-visit follow-up needs. Examples include orthopedic, rehab, cardiology, pulmonary, weight loss, and chronic disease clinics.

### **Ambulatory Surgery Centers**

ASCs are a strong fit because surgery preparation and recovery require structured, time-sensitive communication and follow-up. Subflow can automate pre-op education, reminders, recovery check-ins, and outcome collection.

## **Physical Therapy and Rehab Organizations**

These groups benefit from improved adherence, exercise education delivery, remote follow-up, progress tracking, and communication between visits.

## **Health and Wellness Programs**

Subflow can support virtual coaching, wellness subscriptions, lifestyle programs, obesity/weight loss engagement, and other programs where ongoing communication and adherence matter.

## **Payers and Value-Based Care Organizations**

Payers and risk-bearing entities care about adherence, outcomes, utilization reduction, and longitudinal engagement. Subflow can support outreach, education, navigation, reminders, and engagement strategies tied to better total cost of care.

## **Hospitals and Health Systems**

Hospitals can use Subflow for discharge follow-up, referral support, care transitions, education, and downstream care coordination.

## **Clinical Trials and Research Programs**

Trial participation depends heavily on patient adherence, education, follow-through, and ongoing engagement. Subflow can help automate reminders, instructions, check-ins, and participant communication.

## **Employer Health and Population Health Programs**

Subflow can support longitudinal engagement models that aim to improve preventive behavior, condition management, or care participation over time.

# **Main Use Cases and Applications**

Subflow is flexible, but there are several recurring use cases where it is especially valuable.

## **Pre-Op Communication and Education**

Patients often need timely instructions before surgery or procedures. Subflow can automate:

- preparation reminders
- fasting instructions

- educational content
- forms
- appointment reminders
- required next steps before the procedure

## **Post-Op Recovery and Follow-Up**

After surgery or treatment, patients often need guidance and monitoring. Subflow can support:

- recovery education
- symptom check-ins
- patient-reported outcomes
- follow-up surveys
- adherence reminders
- escalation to staff when needed

## **New Patient Onboarding**

Organizations can use Subflow to onboard patients more effectively with:

- welcome messages
- forms
- intake surveys
- educational resources
- next-step guidance
- reminders about required actions

## **Chronic Care Management**

Chronic care depends on consistency over time. Subflow can support:

- recurring check-ins
- educational content
- medication or behavior reminders
- symptom tracking
- escalation workflows
- adherence monitoring

## **Referral Coordination and Care Navigation**

Referrals are often fragmented and difficult to close. Subflow can help guide patients to the next point of care by:

- sending referral instructions
- reminding patients to schedule
- checking whether appointments were completed
- educating patients about what to expect

- alerting staff when follow-through breaks down

## **Digital Health Education**

Many organizations need better ways to deliver trusted content. Subflow can turn static resources into timed, relevant educational experiences tied to patient journeys.

## **Survey and Feedback Automation**

Subflow can replace or enhance standalone tools used for:

- NPS
- post-visit feedback
- patient satisfaction
- recovery questionnaires
- quality improvement data collection

## **Population Health Outreach**

Organizations can use Subflow to engage groups of patients around:

- preventive screenings
- annual wellness outreach
- chronic condition populations
- recall programs
- longitudinal education campaigns

## **Virtual and Hybrid Care Programs**

Subflow is useful for programs that extend care beyond in-person visits, including:

- virtual rehab
- coaching
- wellness subscriptions
- digital education pathways
- remote support programs

## **Why Customers Buy Subflow**

Customers usually buy Subflow because they have one or more of the following pains:

- too much manual follow-up
- poor patient adherence
- inconsistent communication
- low visibility into what happens between visits
- fragmented tools
- inability to scale outreach and education
- desire to automate repetitive workflows

- lack of actionable engagement data
- poor patient experience caused by friction
- need to create new digital service lines or care pathways

They also buy because they want:

- a better patient experience
- improved staff efficiency
- better outcomes
- higher engagement
- more scalable care programs
- measurable evidence of participation and adherence

## **Common Product Themes Support Should Understand**

There are several themes that come up repeatedly in how Subflow is positioned and used.

### **Frictionless Access**

A central belief in the product is that fewer barriers lead to higher participation. This is why SMS and low-friction web access matter so much in the product story.

### **Automation With Human Oversight**

Subflow is not about replacing care teams. It is about automating repetitive work and making it easier for staff to intervene when human attention is actually needed.

### **Longitudinal Care**

Subflow is designed for ongoing journeys, not just single messages or isolated appointments.

### **Evidence-Based Delivery**

The platform is intended to help organizations deliver real, structured care and education based on their programs and protocols, not random outreach.

### **Measurable Engagement**

Subflow places strong value on capturing data about what patients actually do, not just what was sent.

### **Actionable Insight**

The data collected should lead to intervention, prioritization, and better workflows, not just sit in a dashboard.

# How Support Teams Should Think About Customer Success With Subflow

For support and documentation teams, it is helpful to understand that customers do not just need help learning software features. They often need help thinking through how the platform maps to their workflows.

That means support may need to understand:

- what event starts a workflow
- what data is required for automation
- what the patient experience should look like
- what content is being delivered
- what triggers the next step
- where integrations fit in
- what outcomes the customer is trying to improve
- which parts are automated versus manual
- how reporting should reflect the program

Subflow is highly workflow-oriented, so good support often depends on understanding the operational and care logic behind an implementation, not just the buttons in the interface.

## Internal Summary in One Paragraph

Subflow Health is a healthcare care orchestration, workflow automation, and patient engagement platform designed to help organizations deliver evidence-based care beyond the traditional visit. It enables providers, payers, and healthcare programs to automate communication, structure digital care journeys, deliver education and surveys, monitor adherence, reduce manual burden, and capture meaningful engagement data across the patient journey. Subflow is especially valuable in workflows that happen before, after, and between visits, such as onboarding, pre-op, post-op, chronic care, referrals, and longitudinal care management. It is not an EHR, but rather the layer that helps healthcare organizations coordinate and scale care outside the clinic in a more patient-friendly, measurable, and operationally efficient way.

## Shorter Internal Positioning Statement

Subflow Health helps healthcare organizations automate and deliver care beyond the visit through structured workflows, frictionless patient engagement, and actionable data.

## Another Useful Internal Positioning Statement

Subflow Health is the infrastructure that helps healthcare organizations design, automate, deliver, and measure longitudinal care programs outside the walls of the clinic.
